

9th European NKOS Workshop

September 9-10, 2010
Glasgow, Scotland

Integrating KOS Registries with Metadata Registries

Hugo Manguinhas
(hugo.manguinhas@ist.utl.pt)
IST / INESC-ID

Introduction

- **Interoperability**, is a requirement when there is a need to exchange information between two Information Systems
- **Question:** What happens if there is a need to exchange information that is described in a data model different from the receiver?
- **Possible Solution:** Interoperability can be achieved by crossing-walking data into a data model expected by the receiver

Information and Data Models

Information Model

The abstract description of how information is represented in a specific context (a business area, an organization or a community)

Data Model

How an Information Model is represented for a specific syntax (XML Schema, SQL-DDL, etc.) and/or storage method (file, database, etc.)

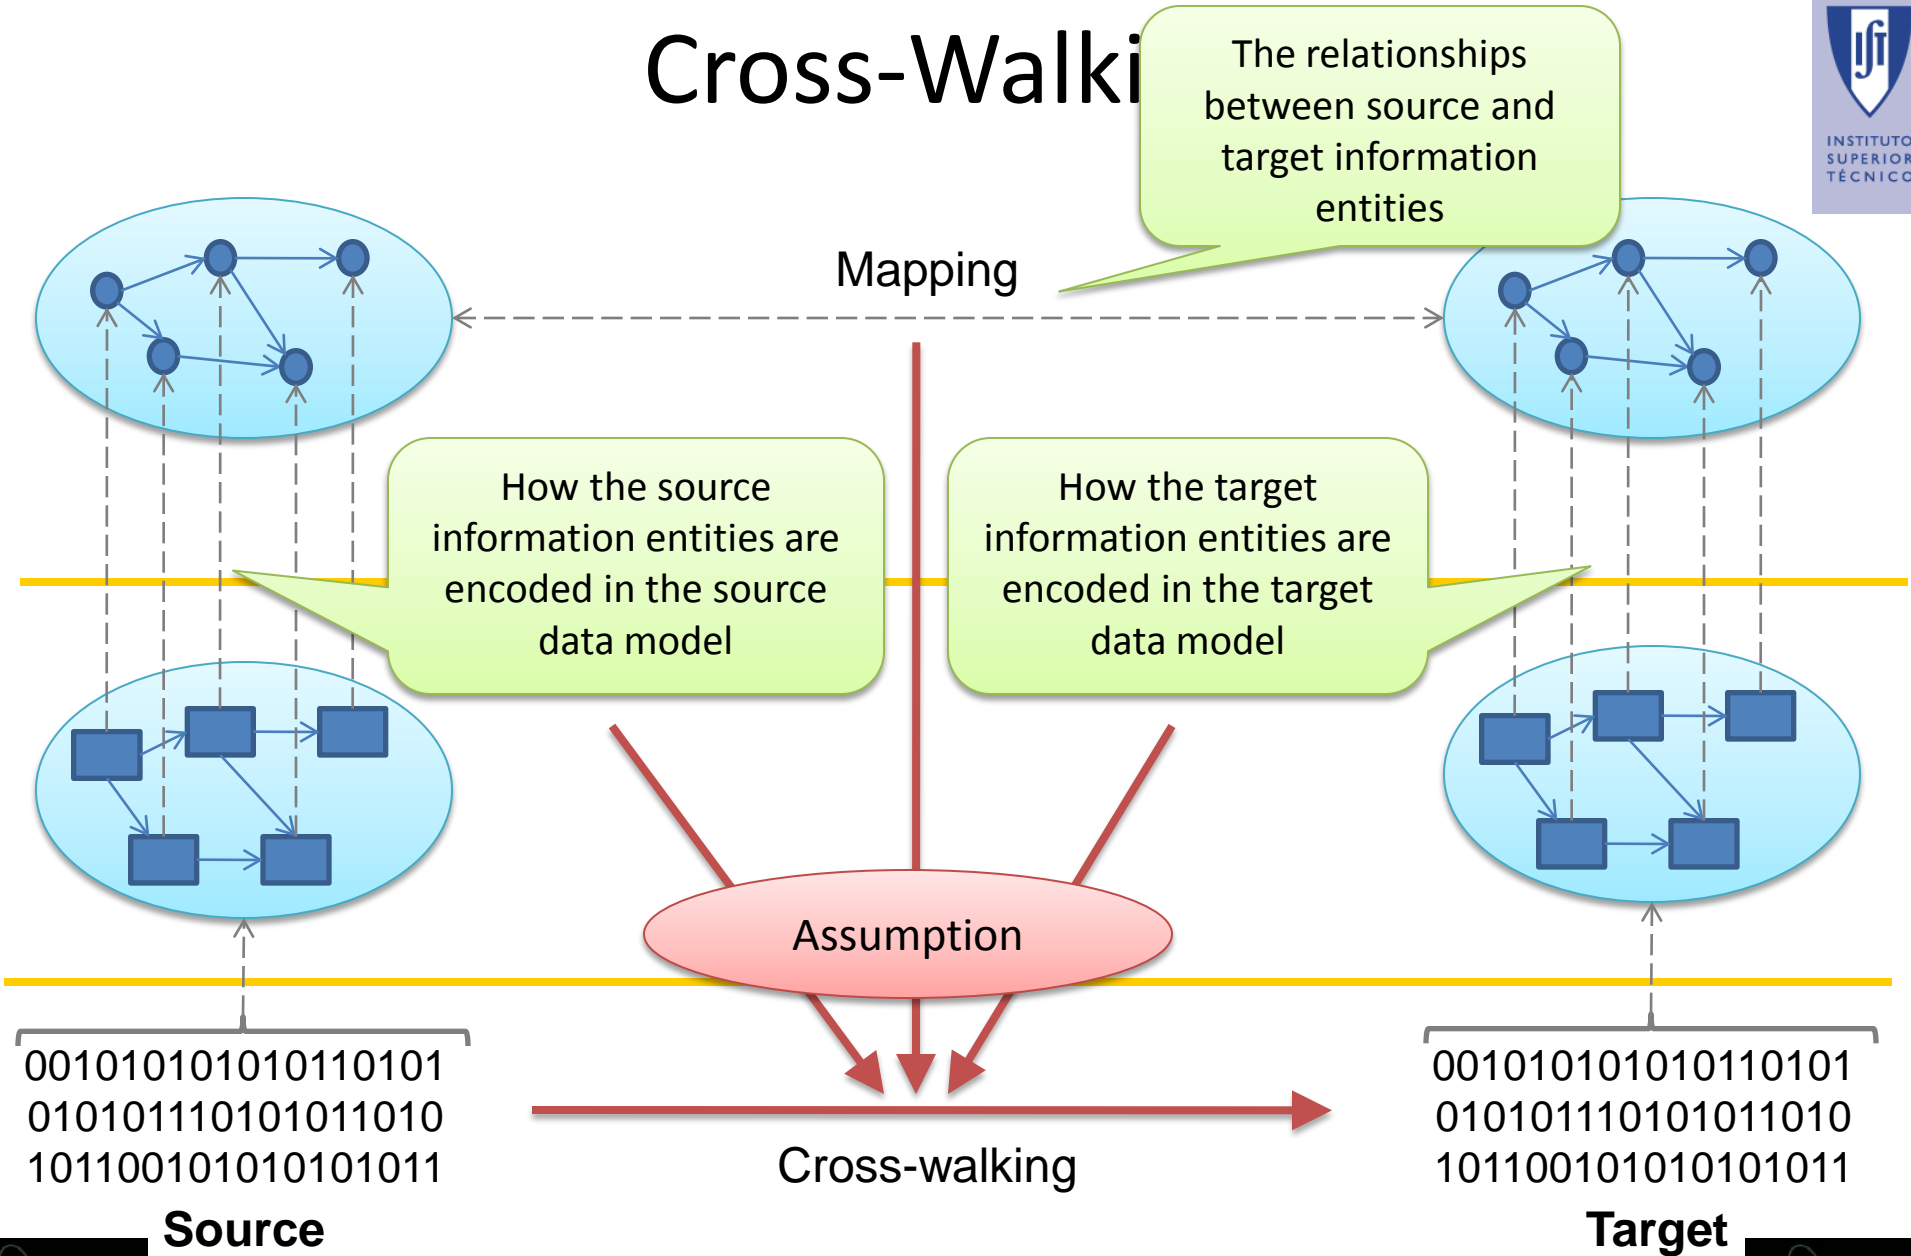

```

001010101010110101
010101110101011010
101100101010101011
  
```

Data

Cross-Walki

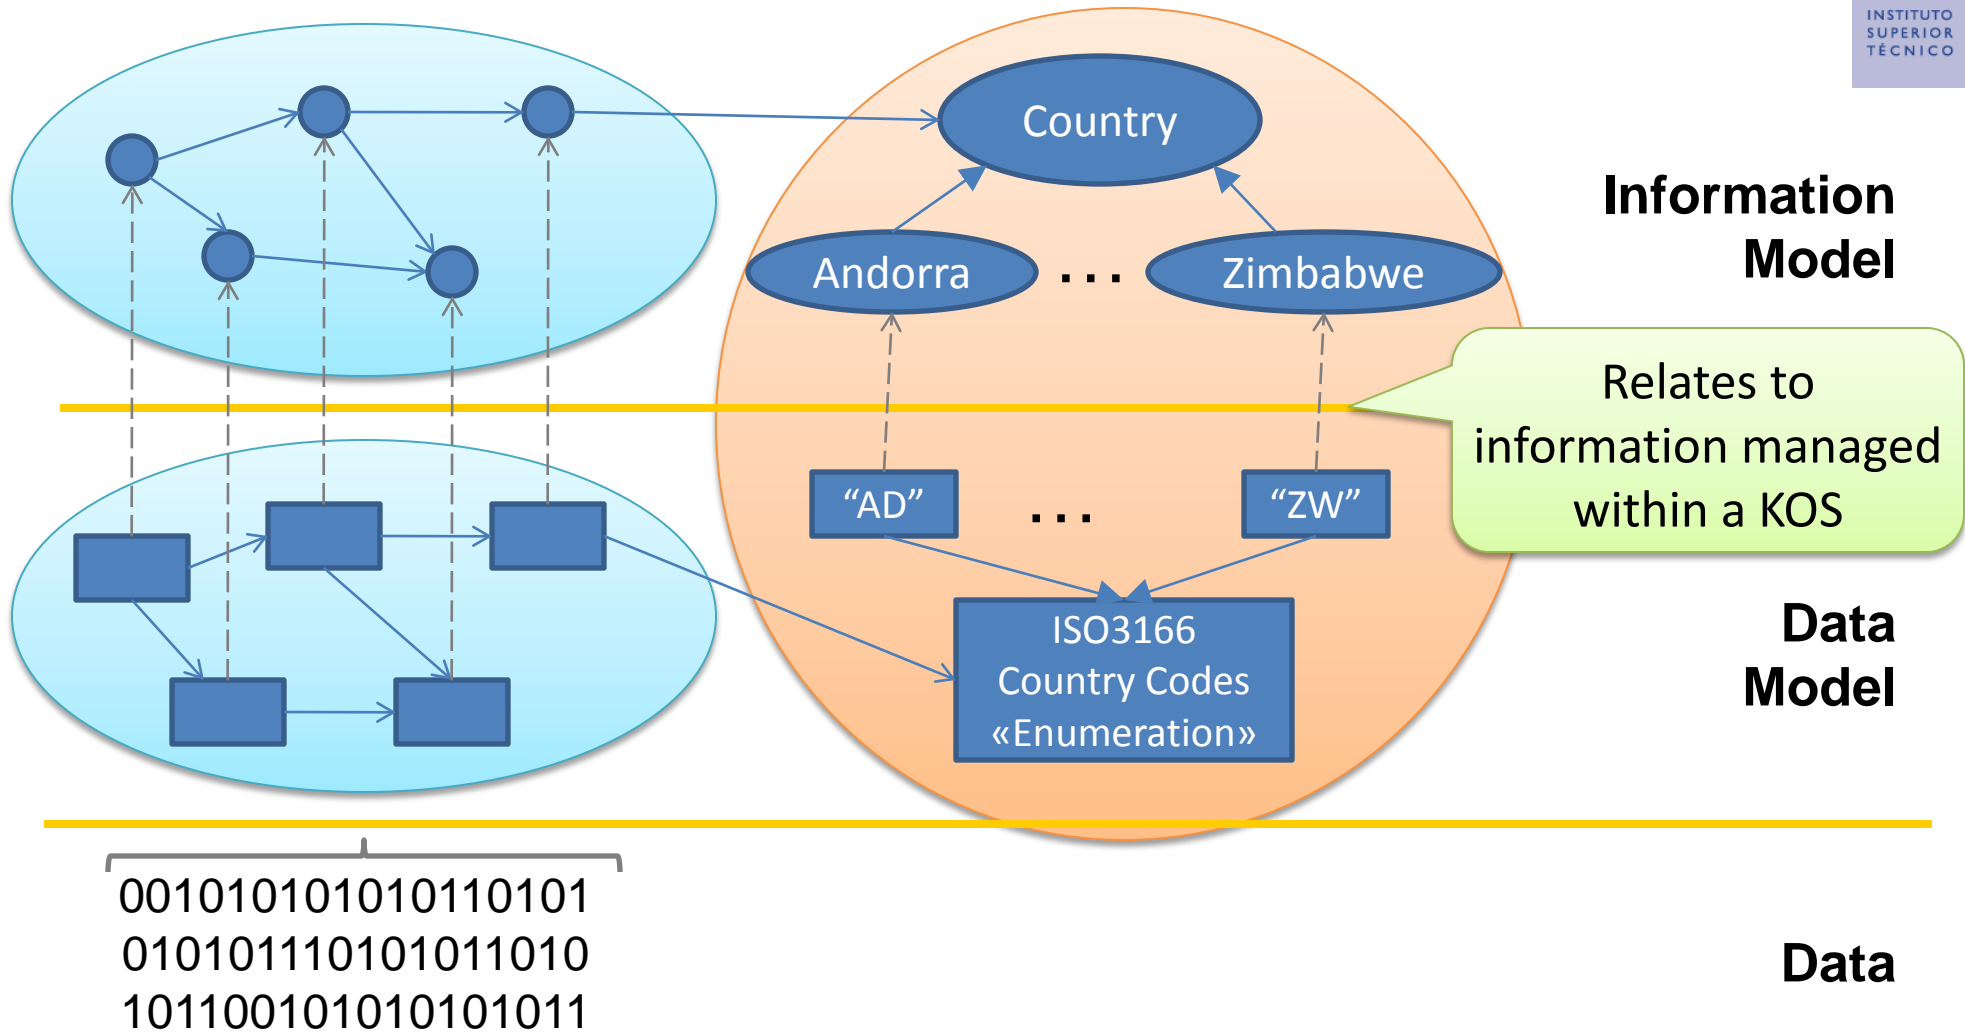

About Metadata Registries

- The information needed to describe these models has been called **metadata**
 - In opposition to the term “data”, to refer to the data objects representing the instances of the data model.
- Associated to that resulted the concept of **Metadata Registries (MDR)**, defined as information systems to manage and publish metadata

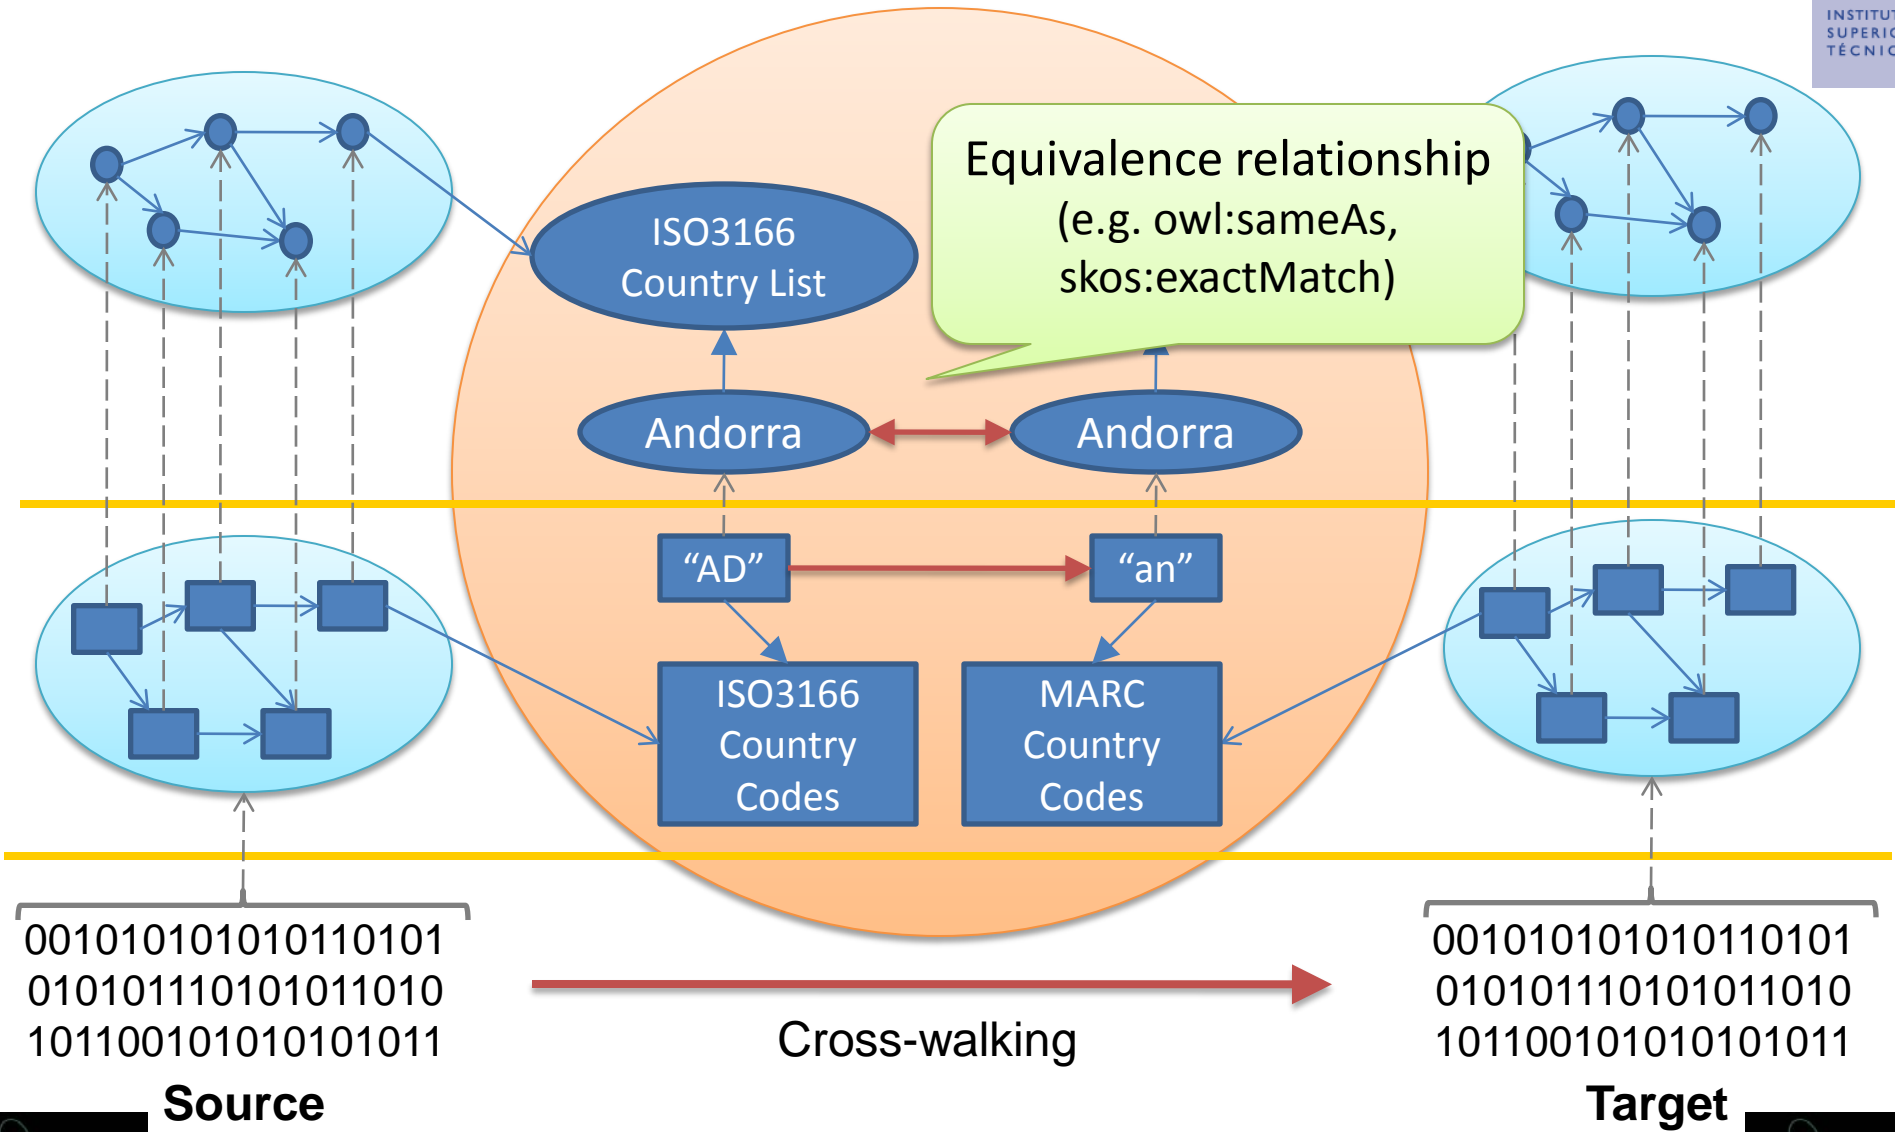

More about Metadata Registries

- A central location (e.g. repository) in an organization where metadata is stored and maintained in a controlled environment.
- Standards for Metadata Registries
 - ISO/IEC 11179 (main standard)
 - The ISO/IEC 20944 - Metadata Registries Interoperability and Bindings (MDR-IB)
 - The ISO/IEC 19763 - Metamodel Framework for Interoperability (MFI)

Information managed within a MDR

Relevance of KOS information for Cross-walking

```
0010101010101110101
0101011110101011010
1011001010101010111
```

Source

Cross-walking

```
0010101010101110101
0101011110101011010
1011001010101010111
```

Target

KOS Registries and MDRs

- KOS registries can be a valuable source of information for MDRs
- Making KOS Registries and MDRs interoperable would be beneficial for both communities!

Possible approaches to Interoperability

- Build KOS registries compliant with the ISO11179 series of standards
 - Immediate integration through MDR-IB interface
- Provide support for MDR-IB compliant interfaces in KOS registries
 - By extending the services interfaces or building a wrapper service
 - Easiest approach to implement
- Provide support for the integration of KOS Registry service interfaces in a MDR
 - Harder approach if no standard interface for KOS registries is defined

Thank You !!!
